

## Sperm Count Control

Sperm-Chex® Post VC is a positive/negative manual post-vasectomy sperm count control that contains stabilized sperm cells. It is currently the only FDA-cleared post-vasectomy sperm count control on the market that contains sperm.

### Accurate

Sperm-Chex Post VC is the only post-vasectomy control on the market that contains sperm cells. Competitor controls contain latex beads which do not look like sperm and do not have the same chamber loading or optical characteristics as Sperm-Chex Post VC.

### Comprehensive

When handled like a patient sample, Sperm-Chex Post VC provides a positive sperm count and a negative sperm count sample to validate the manual post-vasectomy sperm count procedure.

### Cost Effective

Sperm Chex Post VC has 12-month closed-vial stability, allowing laboratories to order once a year and save on shipping costs.

Stability	
Closed-vial	12 months
Open-vial	42 days

### Associated Product

Streck also offers Sperm-Chex®, a two-level manual sperm count control that contains stabilized sperm cells. Other products for manual control procedures include Cell-Chex®, ESR-Chex and Retic-Chex® II.
